

Endodontic Lab, Quiz 4B

February 10, 2003

Name

Name

Seat No. C-10

In a clinical situation, every tooth treated for endodontics must be isolated with a rubber dam. List three reasons stated in the lab manual for the placement of the rubber dam on the tooth.

81. To cause a free saliva working field
82. Retract the soft tissue
83. Protect the patient from swallowing instruments or clamps.

According to lab manual, the exact measurement of root canal(s) of a posterior tooth is the distances from

84. Cusp tip to 85. apical foramen

86. The clamp selection is very important when placing on the rubber dam. As stated in lab manual, which of the following clamps would not be suitable for incisors and cuspids. 0,00 9

A - No. 0

B - No. 9

C - No. 14

D - No. 00

List at least 3 purposes stated in the lab manual why radiographic analysis of clinical endodontic procedures is performed throughout the endodontic treatment.

87. To Get exact measurements and no debris in root Canal
88. Make sure the Gutta Percha is placed in the end of the root Canal.
89. Make sure no voids are present during the lateral Condensation by accessory cones

As stated in lab manual, list two consequences of not removing all the pulp tissue from the chamber when accessing a maxillary pre-molar in a clinical situation.

90. Discoloration
91. Pain

Questions 92 through 95 are True or False.

92. In endodontic therapy only the tooth to be treated is isolated with the rubber dam and it is also the tooth that receives the clamp. True
93. When taking radiographs during the endodontic procedure the rubber dam and the rubber dam frame are removed in order to obtain a good x-ray. False
94. The maxillary and mandibular pre molars tilt 30° lingual to the long axis. False
95. The lingual canal orifice of a two-rooted maxillary pre-molar is located just lingual to the central fossa. True

Pretreatment with a provisional restoration may be necessary to provide sufficient structure to successfully place the rubber dam clamp. List four means, stated in lab manual of providing this treatment.

96. Orthodontic Bands.
97. ~~Protective~~ Temporary Restoration
98. Temporary crown
99. Amalgam Build-up.

What is another reason, in addition to the one in the Question above, the lab manual states that pretreatment of a tooth may be needed.

100. Make sure that the root canal ~~are~~
are cleaned properly and the root will not
fracture during treatment.
